M.O.R. TEST BED TANDEM PROJECT

C/O Maintenance Operations Research Unit

This project is on-going and almost constantly in a state of change. Soon it will be back in the field at the Golden Valley Truck Station for evaluation of several new components. A completely new hydraulic valve body has been engineered and installed which includes "wireless" connections with the material controller. Evaluation of a proto-type LED emergency lighting system will be included as well as a newly designed front plow featuring a 45 degree attack angle.
