City and County officials and residents all desire that boulevards be restored to healthy, lush turf after a road construction project. However, boulevards are often a difficult place for grass to grow because of the harsh environment with exposure to sun, foot traffic, and salt residue from winter maintenance. The Local Road Research Board with the guidance of the University of Minnesota and MnDOT developed three tools for local agency staff, turf installers, and residents. The tools include a step-by-step best practice method to grow turf in Minnesota from seed or sod.
